

## **Web-Based Call Center Sales Board**

I am looking for an experienced web developer to create a custom, web-based sales leaderboard for a call center. The sales board will be displayed full-screen on a large TV in the office and will show each sales agent's daily and weekly sales totals in real time.

The system must include a separate manager dashboard where an authorized manager can add sales, manage agents, correct totals, and send daily reports.

### **Main Objective**

The goal is to create a fun, energetic, and competitive sales board that motivates agents throughout the day.

Whenever an agent gets a sale, the manager should be able to quickly click the agent's name and add one sale. The TV display should immediately update and play an exciting animated "BOOM" celebration showing the agent's name.

After the animation finishes, the agent's daily and weekly sales totals should remain updated next to their name.

### **User Roles**

#### **Manager/Admin**

The manager must have a secure, password-protected dashboard that can be accessed from a computer, tablet, or phone.

The manager should be able to:

- Add, edit, deactivate, or remove sales agents.
- Add one or multiple sales to an agent.
- Subtract or correct a sale entered by mistake.
- View each agent's daily and weekly totals.
- Reset daily totals.
- Start a new sales week.
- Review previous daily and weekly results.
- Email and download sales reports.
- Change basic sales-board settings.
- Manually activate a celebration animation if needed.

## **TV Display**

The TV display will be a separate, read-only screen designed to remain open in a web browser throughout the workday.

No manager controls, edit buttons, or passwords should appear on the TV display.

## **TV Sales Board Layout**

The TV display should be visually attractive, easy to read from across a call center, and designed for a 16:9 widescreen television.

Each agent should have a clearly visible section showing:

- Agent's name.
- Agent's photo or avatar, if uploaded.
- Today's sales total.
- Current week's sales total.
- Current leaderboard position.
- Optional daily or weekly goal progress.

The board should automatically rank agents based on their sales totals. The highest-performing agent should appear at the top or receive a clear visual highlight.

The display should include:

- Company name or logo.
- Current date and time.
- Daily team sales total.
- Weekly team sales total.
- Daily team goal.
- Weekly team goal.
- Progress bars for team goals.
- A clean and professional background.
- Large text that is easy to read on a TV.
- Automatic updates without refreshing the browser.

- Full-screen mode with no unnecessary menus or controls.

The board should support approximately 10 to 30 agents, with the ability to add more later.

### **Sale Entry Process**

The manager dashboard should make entering a sale extremely fast.

A preferred workflow would be:

1. The manager opens the dashboard.
2. The manager sees a button or card for each agent.
3. The manager clicks “Add Sale” next to the agent’s name.
4. The sale is immediately recorded.
5. The TV display automatically plays the sales celebration.
6. The agent’s daily and weekly totals automatically increase.
7. The team totals and leaderboard rankings automatically update.

The manager should not need to reload either screen.

There should also be an option to enter multiple sales at once and to reverse or delete an incorrect entry.

Each sale should be saved as an individual transaction with:

- Agent’s name or ID.
- Date.
- Exact time.
- Manager who entered the sale.
- Number of sales entered.
- Any correction or deletion history.

### **Animated “BOOM” Celebration**

Every time a sale is added, the TV screen should display a full-screen or large overlay animation.

The celebration should include:

- The word “BOOM!”
- The agent’s name.
- A message such as “John Just Made a Sale!”
- Explosions, confetti, fireworks, lightning, or another high-energy effect.
- An optional sound effect.
- A duration of approximately three to five seconds.
- A smooth return to the normal sales board after the animation.

The manager should be able to turn the sound on or off and adjust the volume if possible.

The celebration should work even when several sales are added close together. Celebrations should be placed into a queue so that each agent receives recognition without the animations overlapping or being skipped.

The animation should be exciting but should not freeze, slow down, or interfere with the sales board.

### **Daily and Weekly Totals**

The system must separately track:

- Each agent’s daily sales.
- Each agent’s weekly sales.
- Total team sales for the day.
- Total team sales for the week.

Daily totals should reset automatically at a configurable time, such as midnight or the beginning of the next workday.

Weekly totals should reset automatically on a configurable day, such as Monday morning.

Resetting the displayed totals must not permanently delete the historical sales information. All previous results should remain available in the reporting section.

The manager should also have a manual “Close Day” button.

Before closing the day, the system should ask the manager to confirm the action to prevent accidental resets.

## **End-of-Day Email and Spreadsheet**

At the end of the day, the manager should be able to click one button labeled something similar to:

### **Close Day and Email Report**

When clicked, the system should:

1. Finalize the day's sales totals.
2. Generate a spreadsheet report.
3. Email the spreadsheet to one or more saved email addresses.
4. Save a copy of the report inside the system.
5. Reset the daily board for the next workday, after confirmation.

The report should preferably be generated as an Excel file in .xlsx format. A CSV download option may also be included.

The spreadsheet should contain:

- Report date.
- Each agent's name.
- Each agent's daily sales total.
- Each agent's current weekly sales total.
- Each agent's daily ranking.
- Each agent's weekly ranking.
- Team's total daily sales.
- Team's total weekly sales.
- Daily team goal.
- Percentage of the daily goal achieved.
- Time of each recorded sale, if available.
- Any corrections or adjustments made during the day.

The spreadsheet should be professionally formatted with clear headings, readable columns, and totals.

The manager should be able to:

- Add or remove report recipients.
- Send the report to multiple email addresses.
- Download the report manually.
- Resend a previous report.
- Select a previous date and generate another report.
- View whether the email was successfully sent.

### **Reporting and History**

The manager dashboard should include a reporting section where the manager can select a date range and view:

- Sales by agent.
- Sales by day.
- Sales by week.
- Team totals.
- Agent rankings.
- Average daily sales.
- Best-performing day.
- Top-performing agent.
- Sales entry history.
- Corrections or deleted sales.

Reports should be downloadable in Excel or CSV format.

Historical results should not be lost when the daily or weekly leaderboard resets.

### **Settings**

The manager should be able to customize:

- Company name.
- Company logo.

- Agent names.
- Agent photos or avatars.
- Daily team sales goal.
- Weekly team sales goal.
- Individual agent goals.
- Start day of the sales week.
- Daily reset time.
- Weekly reset day and time.
- Celebration sound on or off.
- Celebration animation style.
- Email report recipients.
- Time zone.
- TV display colors or theme.

### **Technical Requirements**

The system must:

- Be fully web-based.
- Work in modern versions of Chrome, Edge, and Safari.
- Work on Windows computers, tablets, and smartphones.
- Be optimized for display on a 16:9 television.
- Update the TV display in real time without refreshing.
- Use a secure login for managers.
- Store all sales and historical reports in a database.
- Protect the system from unauthorized changes.
- Include automatic database backups or clear backup instructions.
- Be responsive on desktop, tablet, and mobile devices.
- Continue operating reliably throughout an eight-hour workday.

- Use clean, organized, and maintainable code.
- Include error handling if the internet connection is temporarily interrupted.
- Prevent duplicate sales if the manager accidentally clicks the button multiple times.
- Show a confirmation or undo option after a sale is added.

The TV display should have a unique private URL or secure display code so it can remain logged in without exposing manager controls.

### **Preferred Real-Time Functionality**

Real-time updates may be built using WebSockets, Firebase, Supabase Realtime, or another reliable real-time technology.

I am open to the developer's recommended technology as long as:

- The board updates immediately.
- The system is secure.
- The monthly operating cost is reasonable.
- The system is easy to maintain.
- I receive full access and ownership of the project.

### **Deliverables**

The completed project should include:

- Functional manager dashboard.
- Functional TV sales-board display.
- Agent management system.
- Real-time sale updates.
- Animated "BOOM" sale celebration.
- Daily and weekly tally system.
- Automatic daily and weekly resets.
- Historical reporting.
- Excel and CSV report generation.

- End-of-day email report function.
- Mobile-friendly manager controls.
- Secure login system.
- Database setup.
- Deployment to a live website or server.
- Source code and database files.
- Installation and deployment instructions.
- Basic user instructions for managers.
- A reasonable period for testing and bug fixes after delivery.

### **Ownership and Access**

I must receive full ownership and administrative access to:

- The website.
- Source code.
- Database.
- Hosting account or deployment.
- Domain configuration, if applicable.
- Email-reporting service.
- Any third-party accounts created for the project.

The project should not depend on the developer's personal accounts after completion.

Please clearly identify any expected ongoing costs, including:

- Website hosting.
- Database hosting.
- Email delivery service.
- File storage.
- Real-time update service.
- Paid animation or design licenses.

- Maintenance fees.

### **Information to Include in Your Proposal**

Please provide:

- Examples of similar dashboards, leaderboards, or real-time applications you have created.
- Your recommended technology and why you recommend it.
- Estimated completion time.
- Total fixed price.
- Number of revisions included.
- Ongoing monthly costs.
- Whether deployment is included.
- Whether source-code ownership is included.
- Length of the post-delivery bug-fix period.
- Any questions or recommendations you have about the project.

The final product should be energetic and fun for the sales agents while remaining professional, reliable, and very easy for the manager to operate.

This version gives developers enough detail to provide a more accurate fixed-price quote and reduces the chance of unexpected add-on charges.
